

ABSTRACT OF THE DISCLOSURE

A sectional door (20) having a plurality of panels (21) joined for moving between open and closed positions of the door and having pinch resistant panel-to-panel interfaces (41), said panels having a body portion (21') spacing said interfaces, an inner surface (23) and an outer surface (22) of said body portion, and decorative components (31, 32) arranged in a patterned design upon said outer surface of said body portion, said decorative components being positioned on said panels proximate to said panel-to-panel interfaces and attached to said panels for movement of said decorative components to provide a pinch resistant interface between decorative components on adjacent of said panels.
